

Responsive Portfolio — Defect Log

M4 browser QA · responsive layout retest · individual fixes committed separately

Final verification was performed in the browser at 320px, 768px, and 1440px. Intermediate widths were also checked. PASS records whether the chosen layout and containment behavior met the retest criteria; it does not mean every AI symptom was accurately described.

Report	Viewport	Finding	Decision / retest
01	320px	Navigation exceeded narrow viewport	Reproduced · fixed · PASS
02	320px	Skill cards/label allegedly too narrow	Partially reproduced · adjusted · PASS
03	320px	Three project cards too narrow	Reproduced · fixed · PASS
04, 05, 07, 08	768px / 1440px	Long About/Contact strings overflowed	Reproduced · shared fix · PASS
06	1440px	Skills grid allegedly left unused space	Partially reproduced · rejected

320px layout reports

Report 01 — Navigation

AI symptom: The navigation content extends beyond the viewport at 320px.

Reproduction: Reproduced.

Hypothesis: The title and navigation links share a flex row whose combined minimum width is larger than the available content width.

Fix: Allow the navigation and links to wrap at narrow widths so links can use another line when needed.

Retest: At 320px, all links remain visible over two lines; the nav does not overflow, and the document has no horizontal overflow.

Result: PASS. **Commit:** d164aa3. **Evidence:** M4-screens/320-before.png and 320-after.png.

Report 02 — Skills

AI symptom: Four cards become extremely narrow and “JavaScript” does not fit at 320px.

Reproduction: Partially reproduced.

Actual finding: Four cards occupied a grid wider than the content area, but “JavaScript” fit its intrinsically wider card. The AI overstated the label symptom.

Hypothesis and decision: Four columns are unsuitable at phone width; intrinsic sizing expanded the grid. I chose one skill card per row for readability.

Fix and retest: Use one column below 600px. At 320px, cards fit the 256px grid and all labels fit.

Result: PASS. **Commit:** b199de0. **Evidence:** M4-screens/320-before.png and 320-after.png.

Report 03 — Projects

AI symptom: Three project cards have insufficient usable space at 320px.

Reproduction: Reproduced.

Hypothesis: Three columns at phone width leave too little room for project text and can exceed the available grid width.

Fix and retest: Use one column below 600px. At 320px, cards stack, each is about 256px wide, and the grid does not overflow.

Result: PASS. **Commit:** 952e794. **Evidence:** M4-screens/320-before.png and 320-after.png.

Long-string text reports

Reports 04, 05, 07, and 08 were separate symptoms caused by the same type of content: long uninterrupted strings without normal word-break opportunities.

Report 04 — About at 768px

Reproduction: Reproduced. **Hypothesis:** The unbroken sequence was wider than its paragraph, so normal wrapping could not contain it.

Retest: Paragraph scroll width equals its client width (632px); no document overflow. **Result:** PASS.

Evidence: M4-screens/768-before.png and 768-after.png.

Report 05 — Contact at 768px

Reproduction: Reproduced. **Hypothesis:** Contact had the same uninterrupted-string wrapping problem as About.

Retest: Paragraph scroll width equals its client width (632px); no document overflow. **Result:** PASS.

Evidence: M4-screens/768-before.png and 768-after.png.

Report 07 — About at 1440px

Reproduction: Reproduced. The paragraph was about 1,197px wide; unbroken text scroll width was about 2,131px.

Retest: Text is contained; no document overflow. **Result:** PASS.

Evidence: M4-screens/1440-before.png and 1440-after.png.

Report 08 — Contact at 1440px

Reproduction: Reproduced. The paragraph was about 1,197px wide; unbroken text scroll width was about 2,281px.

Retest: Text is contained; no document overflow. **Result:** PASS.

Evidence: M4-screens/1440-before.png and 1440-after.png.

Shared fix: Apply overflow-wrap: anywhere to About and Contact paragraphs. **Commit:** cb34d97.

Report 06 — investigated and rejected

Skills at 1440px

AI symptom: Skills stays two columns and leaves substantial unused space.

Reproduction: Partially reproduced. The two-column layout is real; the unused-space claim was not confirmed.

Finding: The grid spans the available content width, with tracks about 588px each.

Decision: Rejected as a defect. The layout was considered usable and no change was made.

Evidence: Browser measurement and M4-screens/1440-after.png.

Final result: At 320px, 768px, and 1440px, the browser checks found no horizontal document overflow. Reports 01–05, 07, and 08 were addressed; Report 06 remains explicitly rejected based on measured grid width.
